  Title:
Perfect score:
   OM protein - protein search, using sw model
  Searched:
   Scoring table:
   Total number of hits satisfying chosen parameters:
   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

   TISSUE=Uterus
   Name=3; Synonyms=NAC gamma;
Isoid=Q9C000-3; Sequence=VSP_004326, VSP_004327;
Name=4; Synonyms=NAC delta;
Isoid=Q9C000-4; Sequence=VSP_004326;
Isoid=Q9C000-4; Sequence=VSP_004326;
ISSUE SPECIFICITY: Widely expressed. Isoforms 1 and 2 are expressed in peripheral blood leukocytes, chronic myelogenous leukemia cell line K-562, followed by thymus, spleen and heart.
  phirer K., Beyer A., Mewes H.-W., Gassenhuber J., Wiemann S.;
mitted (SEP-1999) to the EMBL/GenBank/DDBJ databases.

FUNCTION: Able to form cytoplasmic structures termed death effector filaments. Enhances APAF1 and cytochrome c-dependent activation of pro-caspase-9 and consecutive apoptosis. Seems to bind ATP.

SUBUNIT: Interacts strongly with caspase 2, weakly with caspase 9 and with APAF1 in a cytochrome c-inducible way leading to the formation of an apoptosome. This interaction may be ATP-dependent. SUBCELLULAR LOCATION: Cytoplasmic.

ALTERNATIVE PRODUCTS:
   Also detected in lung, placenta, small intestine, of liver and muscle.

SIMILARITY: Contains 1 DAPIN domain.

SIMILARITY: Contains 1 NACHT domain.

SIMILARITY: Contains 1 CARD domain.

SIMILARITY: Contains 7 leucine-rich (LRR) repeats.
   Event=Alternative splicing, Named isoforms=4; Name=1; Synonyms=NAC beta, DEFCAP-L; IsoId=09C000-1; Sequence=Displayed; Name=2; Synonyms=NAC alpha, DEFCAP-S; IsoId=09C000-2; Sequence=VSP_004327;
   e proteins in vitro.

DISRASE: Defects in CIAS1 are the cause of chronic infantile DISRASE: Defects in CIAS1 are the cause of chronic infantile neurologic cutaneous and articular syndrome (CINCA), also known as 'neonatal onset multisystem inflammatory disease,' or NOMID, a rare congenital inflammatory disorder characterized by a triad of neonatal onset of cutaneous symptoms, chronic meningitis, and joint manifestations with recurrent fever and inflammation.

SIMILARITY: Contains 1 DAPIN domain.

SIMILARITY: Contains 1 NACHT domain.

SIMILARITY: Contains 1 NACHT domain.

SIMILARITY: Contains 1 leucine-rich (LIRR) repeats.

CAUTION: Ref. 4 sequence differs from that shown due to frameshifts in positions 893, 918 and 926.
   J. Hum. Genet. 70:1498-1506(2002).
   in the other tissues tested.

DISEASE: Defects in CIASI are a cause of familial cold autoinflammatory syndrome (FCAS), commonly known as familial cold urticaria. FCAS is rare autosomal dominant systemic inflammatory disease characterized by episodes of rash, arthralgia, fever and conjunctivitis after generalized exposure to cold.

DISEASE: Defects in CIASI are a cause of Muckle-Wells syndrome (MWS), a rare autosomal dominant fever syndrome with episodic urticaria, arthralgia, amyloidosis and progressive sensorineural
  expressed in polymorphonulclear cells, undetectable or expressed at a lower magnitude in B and T lymphoblasts, respectively. High

   FUNCTION: May mediate activation of CASP1 via ASC and promotactivation of NF-kappa-B (By similarity).

SUBCELLULAR IOCATION: Cytoplasmic (By similarity).

SUBCELLULAR IOCATION: Cytoplasmic (By similarity).

SIMILARITY: Contains 1 DAFIN domain.

SIMILARITY: Contains 1 NACHT domain.

SIMILARITY: Contains 3 leucine-rich (LRR) repeats.

CAUTION: The N-terminus was extended using ESTs and genomic
  sequences, in analogy to ortholog sequences.

   Event-Alternative initiation;

Event-Alternative initiation:

Comment-2 isoforms, 1/Nod2 (shown here) and 2/Nod2b, are

produced by alternative initiation. Both isoforms can activate

NF-kappab. Isoform 1 is more abundant;

ISSUE SPECIFICITY: Monocytes-specific.

IDISEASE: Defects in CARD15 are the cause of Blau syndrome (BS)

[MIM:186580], a rare autosomal dominant disorder characterized by

early-onset granulomatous arthritis, uveitis and skin rash.

IDISEASE: Defects in CARD15 are a cause of susceptibility to

Crohn's disease (CD) [MIM:26600], a form of remitting

inflammatory bowel disease. CD may involve any part of the

gastrointestinal tract, but most frequently the terminal ileum and

colon. Bowel inflammation is transmural and discontinuous. Crohn's

disease is commonly classified as autoimmune disease.

IDISEASE: Defects in CARD15 are a cause of susceptibility to

ulcerative colitis [MIM:191390], a chronic inflammatory bowel

disease. In ulcerative colitis, the inflammation is continuous and

limited to rectal and colonic mucosal layers. Ulcerative colitis

sis commonly classified as autoimmune disease.

ISIMILARITY: Contains 2 CARD domains.

SIMILARITY: Contains 1 NACHT domain.

SIMILARITY: Contains 6 leucine-rich (LRR) repeats.

Perfect score:
  Run on:
  OM protein - protein search, using sw model
  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
The present sequence is that of cDNA encoding human caspase creatiment domain 5 (CARD-5, see AAB200085). The cDNA was isolated from a testis cDNA library using murine CARD-1. Plasmid EmPMC5 CC containing CARD-5 cDNA is deposited as ATCC PTA-213. CARD-5 CC is an intracellular protein predicted to be involved in regulating CC caspase activation. It is useful as a modulating agent in CC regulating cellular processes include cell growth and cell death. CC Methods of diagnosing and treating patients suffering from a disorder associated with an abnormal level or rate of apoptotic cell death, abnormal activity of the Fas/APO-1 receptor complex, cor abnormal activity of a caspase involve administering a compound that modulates the expression or activity of CARD-3, CARD-4, CARD-5 or CARD-6 e.g. a small molecule, antisense nucleic acid, ribozyme cor polypeptide. Such disorders include cancer, viral infection, autoimmune disorders, neurological diseases, haematological disorders, inflammatory disorders and immune disorders. CARD culcic acids can be used to express CARD proteins in a host cell ceg. for gene therapy applications, to detect a genetic lesion and contains activity.

CC (cysteinyl aspartate specific proteinases) are central to the apoptotic CC program and responsible for the degradation of cellular proteins that CC lead to the morphological changes seen in cells undergoing apoptosis. CC Caspases interact with other caspases via their CARDs and different CC subtypes of CARDs may confer binding specificity. CARD-5 is an CC intracellular protein that is predicted to be involved in regulating CC caspase activation. CARD-5 activates the nuclear factor-kappa B CC (NF-kappaB) transcription factor pathway and binds the CARDs of CC caspase-1, CARD-7 and itself. CARD-5 can, therefore, modulate CARD-5 can their card in gene therapy. The CARD-5 polypeptides are useful for cell death CC identifying compounds which bind to them and modulate their activity and CC identifying compounds which bind to them and modulate their activity and CC identifying compounds which bind to them and modulate their activity and CC identifying the presence of CARD-5 polypeptides are useful for cardica caids, antibodies and modulators of CARD-5. Expression or activity can be used to treat immune disorders such as chronic inflammatory CC diseases and disorders, Hashimoto's thyroiditis, graft rejection. CC sarcoidosis, atopic conditions (such as asthma and allergy), glomerular nephritis, human immunodeficiency virus (HIV) and bacterial infections (including tuberculosis and lepromatous leprosy) and in screening and constraint for treating and antifumine disorders. Such as cativity or expression are also caseful for treating antifumine disorders.

CC (NF-kappaB) transcription factor pathway and binds the CARDs of CC caspase-1, CARD-7 and itself: CARD-5 can, therefore, modulate CARD-5 CC activity and NF-kappaB activation, regulate cell growth and cell death CC and be used in gene therapy. The CARD-5 polypeptides are useful for CC identifying compounds which bind to them and modulate their activity and CC for detecting the presence of CARD-5 in a sample. CARD-5 polypeptides, CC nucleic acids, antibodies and modulators of CARD-5 expression or activity CC can be used to treat immune disorders such as chronic inflammatory CC diseases and disorders, Hashimoto's thyroiditis, graft rejection, CC sarcoidosis, atopic conditions (such as asthma and allergy), glomerular CC nephritis, human immunodeficiency virus (HIV) and bacterial infections CC (including tuberculosis and lepromatous leprosy) and in screening and CC detection assays. Modulators of CARD-5 activity or expression are also CC erythematosus and arthritis, cell depletion, neurological disorders, such as Alzheimer's disease, Parkinson's disease and spinal muscular CC aplastic anaemia, myocardial infarction and stroke. The sequence CC presented is the complementary strand to the human caspase recruitment cyc

binding, altered Identifying modulator of CARD-7 and CARD-5 interaction, CARD-7 and CARD-5 in presence of test compound, measuri binding, and identifying modulator, when binding of CAR measuring their g of CARD-7 to C by contacting CARD-5

Disclosure; Fig 7; 43pp; English

that regulate caspase activity using caspase recruitment domain-7 (CARD-7) or caspase recruitment domain-8 (CARD-8). In particular, a method for identifying a compound that modulates the interaction between CARD-8 and caspase-1, pseudo-innerleukin-1 (IL-1) beta converting enzyme (pseudoICE) or ICEBERG is disclosed. CARD-7 and CARD-8 molecules are useful as modulating agents in regulating a variety of cellular processes including cell growth, cell death, and inflammation. The methods of the invention are useful for identifying compounds that have the ability to increase/decrease apoptosis, or present invention relates to methods of identifying compounds

  The invention relates to identification of target of methylation-induced silencing-1 (TMS1) gene. This gene is transcriptionally silenced due to abnormal methylation of a Cpg island in its 5' regulatory region. TMS1 consists of a carboxy terminal caspase-recruiting domain (CARD) and plays a role in induction of apoptosis. TMS1 gene and protein are useful as tools for diagnosing and treating a subject at risk of developing cancer (e.g. breast cancer) characterised by abnormal CpG methylation or abnormally low levels of TMS1 expression products. Unique fragments of TMS1 gene are used as probes. TMS1 gene is useful in gene therapy. TMS1 molecule is also useful for treating abnormal cell proliferation by increasing TMS1 polypeptide level to an above normal level. The CpG island region of TMS1 or its fragments are used to study the methylation patterns apart from any coding region contained in it.
  Novel gene TMS1, transcriptionally silenced due to increased methylation useful for identifying subject at risk of developing tumor characterized by abnormal methylation, for treating cancer by inducing

  The present invention relates the DNA and their encoded proteins, where the proteins contain at least one PYD (pyrin) domain. These can be used to treat diseases associated with impaired intracellular signal transduction, particularly inflammation such as psoriasis, arteriosclerosis, bacterial or viral infections (particularly meningitis and pneumonia), multiple sclerosis, rheumatoid arthritis, asthma, sathma, sarcoidosis, glomerulomephritis and osteoarthritis, and also Alzheimer's and parkingon's diseases. The present sequence is a coding sequence of the inventor.
   New DNA encoding protein with pyrin domain, useful for treating diseases involving impaired signal transduction, particularly inflammation, also proteins and antibodies -

   This invention decribes novel human nucleic acid sequences from tumor breast tissue which have cytostatic activity. The nucleic acid sequences can be used to produce and isolate full-length gene sequences. They can be used to express proteins, which can be used as tools to find an activity against breast cancer. The sequences can be used in sense or antisense form. They are especially useful for medicaments for gene therapy to treat breast cancer. AAZ33611-Z48617 represents expressed sequence tags described in the method of the invention.
  Human nucleic acid sequences and protein tissue, useful for breast cancer therapy
   Homo sapiens

CC AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon CC cancer associated nucleic acid molecules (N) and proteins (P), where CC the proteins are collectively known as colon cancer antigens. The colon CC cancer antigens have cytostatic activity and can be used in gene C therapy and vaccine production. N and P may be used in the prevention, CC diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of by expressing conactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell corporess the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAB7789 represent sequences used in the exemplification of the Query Match Best Local Simi Matches 731; N.B. Pages 666 to 682 and page 7053 of the sequence listing were missing at time of publication, meaning no sequences are present for SEQ ID NO:1027 to 1052, 7921 and 7922. Novel gene TMS1, transcriptionally silenced due to increased methylation useful for identifying subject at risk of developing tumor characterized by abnormal methylation, for treating cancer by inducing

Claim 68; Page 122; 124pp; English

The invention relates to identification of target of methylation-induced CC silencing-1 (TMS1) gene. This gene is transcriptionally silenced due to abnormal methylation of a CpG island in its 5' regulatory region. TMS1 CC consists of a carboxy terminal caspase-recruiting domain (CARD) and CP lays a role in induction of apoptosis. TMS1 gene and protein are useful CC as tools for diagnosing and treating a subject at risk of developing CC cancer (e.g. breast cancer) characterised by abnormal CpG methylation or abnormally low levels of TMS1 expression products. Unique fragments of CT MS1 gene are used as probes. TMS1 gene is useful in gene therapy. CC TMS1 molecule is also useful for treating abnormal cell proliferation by increasing TMS1 polypeptide level to an above normal level. The CpG island region of TMS1 or its fragments are used to study the methylation CC island region or its fragments are used to study the methylation CC patterns apart from any coding region contained in it.

CC The present sequence is alternatively spliced form of human target of methylation-induced silencing-1 (TMS1) cDNA lacking exon2.

   AAC97991 to AAC98763 encode the human colon cancer associated proteins, called human colon cancer antigens, given in AAB53034 to AAB54006. The human colon cancer antigens can have cytostatic, cardioactive, muscular; neuroprotective, immunomodulatory, gynaecological, gastrointestinal, culturerary, nephrotropic, antiinfective and antibacterial activities, and can be used in gene therapy. The colon cancer antigen polynucleotides, and croteins and antibadies to the proteins are useful for the prevention, treatment and diagnosis of colon disorders, such as colon cancer. The polynucleotides may be used in diagnostics and research, such as for chromosome identification, and as hybridisation probes. The proteins may also be used to prevent diseases such as neural disorders, immune system disorders, muscular disorders, reproductive disorders, infectious capset of the present sequences used in the exemplification of the present covering and as hybridisation of the present covering system disorders, reproductive disorders, infectious capset in a cardiovascular disorders. AAC98764 to AAC98772 and AB54007 represent sequences used in the exemplification of the present

The invention relates to identification of target of methylation-induced silencing-1 (TMS1) gene. This gene is transcriptionally silenced due to abnormal methylation of a CpG island in its 5 regulatory region. TMS1 consists of a carboxy terminal caspase-recruiting domain (CARD) and plays a role in induction of apoptosis. TMS1 gene and protein are useful as tools for diagnosing and treating a subject at risk of developing cancer (e.g. breast cancer) characterised by abnormal CpG methylation or

   abnormally low levels of TMS1 expression products. Unique fragments of TMS1 gene are used as probes. TMS1 gene is useful in gene therapy. TMS1 molecule is also useful for treating abnormal cell proliferation by increasing TMS1 polypeptide level to an above normal level. The CpG island region of TMS1 or its fragments are used to study the methylation patterns apart from any coding region contained in it. The present sequence is alternatively spliced form of human target of methylation-induced silencing-1 (TMS1) cDNA lacking exoni.

Note: The present sequence designated as SEQ ID NO:26, is referred as DNA throughout the specification, however this sequence has been

NCI CGAP FT1 is a normalized cDNA library constructed from a pool of 81 RNA samples from Alveolar Macrophages challenged with different treatments. The library was normalized according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT773-Pac vector. The oligonucleotide used to prime that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is GGCCATGCCG. The tissue was provided by Dr. Gary W. Hunninghake of the University of Iowa.

   and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT7T3-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is AACTGTTCGG.

   This invention decribes novel human nucleic acid sequences from tumor breast tissue which have cytostatic activity. The nucleic acid sequences can be used to produce and isolate full-length gene sequences. They can be used to express proteins, which can be used as tools to find an activity against breast cancer. The sequences can be used in sense or antisense form. They are especially useful for medicaments for gene therapy to treat breast cancer. ANY48540-Y48617 represent protein

The invention relates to isolated human polypeptides (which may be CC cytokines) and the polymucleotides encoding them. The protein is useful CC for identifying a compound which binds to it (e.g. modulators, agonists CC and antagonists). The polymucleotides are useful as an array for mismatch CC detection. The proteins and nucleic acids are useful as nutritional CC sources or supplements. The protein exhibits exhibits activity relating CC to cytokine, cell proliferation, cell differentiation, antiinflammatory, stem cell growth factor activity, immune stimulating or immune CC suppressing and activin or inhibin related activities. The proteins (and antibodies raised against them) and nucleic acids are therefore useful in the diagnosis and treatment of diseases and disorders such as cancer, central and peripheral nervous system diseases and neuropathies, cantiner's, Parkinson's disease, amyotrophic CC lateral sclerosis, spinal cord disorders, head trauma, cerebrovascular CC diseases, stroke, myeloid or lymphoid cell disorders, platelet disorders, thromborytopanaia, stem cell disorders, aplastic anaemia, for cregeneration of bone, cartilage, tendon, ligament and/or nerve tissue regenerating osteoporosis, osteoarthritis, bone degenerative disorders, or periodontal disease, lung or liver fibrosis, reperfusion injury in creating osteoporosis, osteoarthritis, bone degenerative disorders, or periodontal disease, various immune deficiencies and disorders including severe combined immunodeficiency (SCID), bacterial or fungal infections, cantolistics, septic shock, sepsis, arthritis, nephritis and inflammatory bowel disease, viral infection and are useful in altering bodily.

   The invention relates to identification of target of methylation-induced silencing-1 (TMS1) gene. This gene is transcriptionally silenced due to abnormal methylation of a Cpg island in its 5' regulatory region. TMS1 consists of a carboxy terminal caspase-recruiting domain (CARD) and plays a role in induction of apoptosis. TMS1 gene and protein are useful as tools for diagnosing and treating a subject at risk of developing cancer (e.g. breast cancer) characterised by abnormal CpG methylation or abnormally low levels of TMS1 expression products. Unique fragments of TMS1 gene are used as probes. TMS1 gene is useful in gene therapy.

TMS1 molecule is also useful for treating abnormal cell proliferation by increasing TMS1 polypeptide level to an above normal level. The CpG island region of TMS1 occasing tredion contained in it.

RESULT 4
  The present sequence is that of human caspase recruitment domain 5 (CARD-5), an intracellular protein predicted to be involved in regulating caspase activation. The sequence is predicted from an isolated cDNA clone (see AAF30007). Methods of diagnosing and treating patients suffering from a disorder associated with an abnormal level or rate of apoptotic cell death, abnormal activity of the fumour necrosis factor receptor complex, abnormal activity of the tumour necrosis factor receptor complex or abnormal activity of a caspase involve administering a compound that modulates the expression or cativity of CARD-3, CARD-4, CARD-5 or CARD-6 e.g. using gene therapy methods. Such disorders include cancer, viral infection, autoimmune disorders, neurological diseases, haematological disorders, inflammatory disorders and immune disorders. CARD-3, CARD-4, CARD-5 or CARD-6 e.g. using gene call survival and cell growth. They can also be used to screen crust disorders associated with insufficient or excessive production of CARD-3, -4, -5 or -6 protein, or production of an absorbarian creation.
   Isolated intracellular proteins predicted to be involved in regulating caspase activation are used for diagnosis and treatment of e.g. cancer viral infections, autoimmune diseases, neurological diseases and

The invention discloses the isolated polypeptides, and encoding nucleic acids, of murine and human caspase recruitment domain (CARD) -5. Caspases (cysteinyl aspartate-specific proteinases) are central to the apoptotic program and responsible for the degradation of cellular proteins that lead to the morphological changes seen in cells undergoing apoptosis. Caspases via their CARDs and different subtypes of CARDs may confer binding specificity. CARD-5 is an
   Novel isolated murine or human caspase recruitment domain (CARD)-5 polypeptide, useful for treating immune disorders such as Hashimoto's thyroiditis, graft rejection, allergy, glomerular nephritis,

  cancer associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAB77789 represent sequences used in the exemplification of the
   present invention. N.B. Pages 666 to 682 and page 7053 of the missing at time of publication, meaning no SEQ ID NO:1027 to 1052, 7921 and 7922.

   The invention relates to identification of target of methylation-induced CC silencing-1 (TMS1) gene. This gene is transcriptionally silenced due to abnormal methylation of a CpG island in its 5' regulatory region. TMS1 CC consists of a carboxy terminal caspase-recruiting domain (CARD) and CC plays a role in induction of apoptosis. TMS1 gene and protein are useful CC as tools for diagnosing and treating a subject at risk of developing CC cancer (e.g. breast cancer) characterised by abnormal CpG methylation or CC TMS1 gene are used as probes. TMS1 gene is useful in gene therapy. CC TMS1 molecule is also useful for treating abnormal cpG methylation by increasing TMS1 polypeptide level to an above normal level. The CpG island region of TMS1 or its fragments are used to study the methylation CC patterns apart from any coding region contained in it.

CC The present sequence is alternatively spliced form of human target of methylation-induced silencing-1 (TMS1) protein lacking exon2.
   Human; target of methylation-induced silencing-1; TMS1; cytostatic; antiproliferative; apoptosis inducer; gene therapy; CpG island; caspase-recruiting domain; CARD; cancer; breast.
   Novel gene TMS1, transcriptionally silenced due to increased methylation useful for identifying subject at risk of developing tumor characterized by abnormal methylation, for treating cancer by inducing

AAC77607 to AAC78448 encode the human cancer associated proteins given in AAB43398 to AAB44239. The proteins can have activities based on the tissues and cells the genes are expressed in. Example of activities include: cytostatic; proliferative; vulnerary; immunomodulator; antidiabetic; antiasthmatic; antirheumatic; antiarthritic; antiherier; antityroid; antiallergic; anticeterial; antiviral; dermatological; neuroprotective; cardiant; thrombolytic; coagulant; nootropic; vasotropic; antipsoriatic and antianglogenic. The polymucleotides and polypeptides can be used for preventing, treating or ameliorating medical conditions and diagnosing pathological conditions. Polymucleotides, polypeptides, antibodies, agonists and antagonists from the present invention may be used to treat immune disorders by activating or inhibiting the proliferation, differentiation or mobilisation of

The invention relates to identification of target of methylation-induced silencing-1 (TMS1) gene. This gene is transcriptionally silenced due to abnormal methylation of property in the stranscriptional regulatory region. TMS1 consists of a carboxy terminal caspase-recruiting domain (CARD) and plays a role in induction of apoptosis. TMS1 gene and protein are useful as tools for diagnosing and treating a subject at risk of developing

methylation

   abnormally low levels of TMS1 expression products. Unique fragments of TMS1 gene are used as probes. TMS1 gene is useful in gene therapy.

TMS1 molecule is also useful for treating abnormal cell proliferation by increasing TMS1 polypeptide level to an above normal level. The CpG island region of TMS1 or its fragments are used to study the methylation patterns apart from any coding region contained in it.

The present sequence is mouse target of methylation-induced silencing-1
Isolated intracellular proteins predicted to be involved in reguicaspase activation are used for diagnosis and treatment of e.g. viral infections, autoimmune diseases, neurological diseases and haematological disorders—

   CC (CARD-5), an intracellular protein predicted to be involved in CC regulating caspase activation. The sequence is predicted from an CC isolated cDNA clone (see AAF30008). It shows 71.8% amino acid cidentity to human CARD-5 (see AAF30008). Methods of diagnosing cC and treating patients suffering from a disorder associated with an CC abnormal level or rate of approtic cell death, abnormal activity of the tumour cC of the Fas/APO-1 receptor complex, abnormal activity of the tumour cC involve administering a compound that modulates the expression or CC activity of CARD-3, CARD-4, CARD-5 or CARD-6 e.g. using gene cc involve administering a compound that modulates the expression or CC therapy methods. Such disorders include cancer, viral infection, CC disorders, inflammatory disorders and immune disorders. CARD-3, CARD-4, 5 and -6 proteins can be used to regulate cell proliferation, CC cell survival and cell growth. They can also be used to screen CC treat disorders associated with insufficient or excessive production of CARD-3, -4, -5 or -6 protein, or production of an

   The invention discloses the isolated polypeptides, and encoding nucleic caids, of murine and human caspase recruitment domain (CARD)-5. Caspases CC (cysteinyl aspartate specific proteinases) are central to the apoptotic CC program and responsible for the degradation of cellular proteins that CC lead to the morphological changes seen in cells undergoing apoptosis. CC Caspases interact with other caspases via their CARDs and different CC subtypes of CARDs may confer binding specificity. CARD-5 is an CC intracellular protein that is predicted to be involved in regulating CC caspase activation. CARD-5 activates the nuclear factor-kappa B CC (NF-kappas) transcription factor pathway and binds the CARDs of CC caspase-1, CARD-7 and itself. CARD-5 can, therefore, modulate CARD-5 CC cativity and NF-kappas activation, regulate cell growth and cell death CC and be used in gene therapy. The CARD-5 polypeptides are useful for CC carbosis, antibodies and modulators of CARD-5 polypeptides, concleic acids, antibodies and modulators of CARD-5 expression or activity and CC for detecting the presence of CARD-5 polypeptides are useful for can be used to treat immune disorders such as chronic inflammatory CC diseases and disorders, Hashimoto's thyroiditis, graft rejections (including tuberculosis and lepromatous leprosy) and in screening and CC carbosis, atopic conditions (such as asthma and allery), glomerular nephritis, man immunodeficiency virus (HIV) and bacterial infections (condition assays. Modulators of CARD-5 activity or expression are also cuseful for treating autoimmune disorders, such as systemic lupus corresponding and activation and activation and storders, such as systemic lupus corresponding and commance disorders, such as systemic lupus corresponding and commans disorders, such as systemic lupus corresponding and commans disorders, such as systemic lupus corresponding and commans disorders, such as systemic lupus corresponding and commans disorders, such as systemic lupus corresponding and corresponding and commans

  The invention relates to identification of target of methylation-induced silencing-1 (TMS1) gene. This gene is transcriptionally silenced due to abnormal methylation of a OpG island in its 5' regulatory region. TMS1 consists of a carboxy terminal caspase-recruiting domain (CARD) and plays a role in induction of apoptosis. TMS1 gene and protein are useful as tools for disgnosing and treating a subject at risk of developing cancer (e.g. breast cancer) characterised by abnormal CpG methylation or abnormally low levels of TMS1 expression products. Unique fragments of TMS1 gene are used as probes. TMS1 gene is useful in gene therapy.
TMS1 molecule is also useful for treating abnormal cell proliferation by increasing TMS1 polypeptide level to an above normal level. The CpG island region of TMS1 or its fragments are used to study the methylation patterns apart from any coding region contained in it.
   Novel gene TMS1, transcriptionally silenced due to increased methylation useful for identifying subject at risk of developing tumor characterized by abnormal methylation, for treating cancer by inducing

  AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P capression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of p by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAB7789 represent sequences used in the exemplification of the

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Note-Inferred from the CDNA sequence of Ref.5;

Note-Inferred from the CDNA sequence of Ref.5;

-!- TISSUE SPECIFICITY: Widely expressed at low levels. Detected in peripheral blood leukocytes, lung, small intestine, spleen, thymus, colon and at lower levels in placenta, liver and kidney. Very low expression in skeletal muscle, heart and brain. Detected in the leukemia cell lines HI-60 and U937, but not in Jurkat T-cell lymphoma and Daudi Burkitt's lymphoma. Detected in the melanoma cell line MM35, but not in MM793. Not detected in HeLa cervical carcinoma cells and Molt 4 lymphocytic leukemia cells.

-!- MISCELLANEOUS: In breast tumorigenesis, methylation-mediated silencing may affect genes and proteins that act as positive mediators of cell death.

-!- SIMILARITY: BELONGS TO THE CARD-CONTAINING ADAPTER PROTEIN FAMILY.
-!- SIMILARITY: Contains 1 DAPIN domain.

   -!- SUBCELULIAR LOCATION: Nuclear (Probable)
-!- TISSUE SPECIFICITY: HIGHLY EXPRESSED IN PERLPHERAL BLOOD
LEUCOCYTES, PARTICULARIY IN MATURE GRANULOCYTES BUT NOT IN
MONOCYTES AND LYMPHOCYTES. NOT EXPRESSED IN SPLEEN, THYMUS,
PLACENTA, LUNG, LIVER, WUSCLE, KIDNEY, PANCREAS.
-!- DISEASE: Defects in MEFV are the cause of familial Mediterranean
fever (FMF) [MIM:249100], an autosomal recessive inherited
disorder characterized by recurrent episodic fever; serosal
inflammation and pain in the abdomen, chest or joints. It is
frequently complicated by amyloidosis, which leads to renal
failure and can be prophylactically treated with colchicine. FMF
primarily affects ethnic groups living around the Mediterranean
basin: North-African Jews, Armenians, Arabs and Turks.

  Title:
Perfect score:
   Run on:
  OM protein - protein search, using sw model
  Searched:
   Scoring table:
   Sequence:
  Total number of hits satisfying chosen parameters:
  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

  protein
       score g
  Pred. No.
  Score
  1
   No. is the number of results predicted by chance to have a greater than or equal to the score of the result being printed, s derived by analysis of the total score distribution.
   protein search, using sw model

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
